

A PROPOSAL FOR VENUE PARTNERS

Every number on Variable carries its source. Here is how PocketPull becomes the sixth venue.

A read-only data partnership: five feeds and one key, in return for full coverage on the terminal the tokenized collectibles market reads.

REPORT AND
THREAD, EVERY
MONDAY

The terminal for tokenized collectibles

Prices, volume, holders, pack and claw economics and a resale index across every venue that tokenizes physical collectibles: graded cards, sealed product, memorabilia and more. Built from on-chain data and venue feeds.

The standard

Every figure carries its window and its source. Anything we cannot defend is withheld and says so. The index publishes with its skew disclosed. Deltas are only printed against days every source has finished reporting. This is why the numbers get quoted rather than argued with.

Who reads it

Collectors deciding where to buy, allocators sizing the category, venue teams benchmarking against each other, and writers covering the market. A weekly report and a public thread go out every Monday, naming venues and their moves.

What we already count

Collector Crypt, Courtyard, Phygital, Beezie and DYLI, on Solana, Base and Polygon. Marketplace resales, primary and pack spend, holders, listings and floors, item metadata down to the cert number, and the payout side of packs and claws where a venue has shared it.

Where a venue appears

SURFACE	WHAT IT SHOWS FOR YOU
Platforms board	Rank, 24h and 7d resale, pack volume, share, sparkline
Your venue page	KPI strip, scoped Index Studio, 14-day cards, top sales with art, items and IPs tables
Economics	Spend, payouts, net and player concentration, with a coverage matrix that says what is counted
Stats and exports	Volume by venue; every chart exports PNG and CSV with a cite line, and embeds
Item pages	Realized sales, listings and buy links back to your marketplace
Weekly report	Named movers, biggest sales, the venue table, every Monday, on site and on X
Index Studio	Your resales inside the monthly resale comparables index and its benchmarks

What a fully counted venue gets

Coverage on Variable is earned by data, not by size. A venue that shares its feeds is measured by the same rules as every other venue, and shows up everywhere the market looks.

01 • A PAGE OF YOUR OWN

Your venue, fully instrumented

KPI strip, a scoped Index Studio with BTC and ETH overlays, 14-day cards, top sales with item art, the items and IPs behind your volume. Refreshed every six hours.

02 • CITABLE NUMBERS

Third-party measured

When Variable says a venue's resale volume grew 114% in a week, it is citable, because the number carries its window and source and was computed the same way for everyone. Your own numbers become something others can quote.

03 • DISTRIBUTION

Named every Monday

The weekly report and the public thread name venues and their moves. Item pages carry buy links back to your listings, so a reader who finds an item on Variable finishes on your marketplace.

04 • EMBEDS AND EXPORTS

Charts you can reuse

Every chart exports as PNG and CSV with a cite line, and every chart embeds. Put your own venue chart, computed by a neutral party, on your site or in your investor update.

05 • ECONOMICS

Your Pack story, told honestly

Spend against payouts, realized odds against stated odds, player tiers and concentration. The page that answers the question every serious buyer asks before they play.

06 • THE INDEX

Shape the benchmark

Your resales move the resale comparables index. The more of your feed resolves to an item identity, the more your market shapes the number the category is measured by.

What readers see when a venue is not counted. A dash where a number should be, "no source" on the coverage matrix, and an exclusion note in player analytics. We label every gap as a data gap, never as a venue fault. Readers still see the blank.

FIVE FEEDS • ONE KEY

What we need, and what each feed powers

Read-only access to your marketplace and pack data. We adapt to what exists: REST and JSON, a webhook, or contract addresses and events we index ourselves. A history export plus a cursor for new rows is enough to start.

FEED	FIELDS	WHAT IT POWERS ON VARIABLE
01 Trades	Token id, price and currency, buyer, seller, timestamp, transaction hash, fee. Full history from launch, then a cursor or webhook for new sales. On-chain venues: contract addresses, payment token and event signatures.	Volume, trades, top sales, item pages, market cap, the resale index
02 Listings	Token id, ask price, timestamp, or the marketplace's listing events.	Floors, market cap, buy links
03 Pulls	Pull id, pack id, price paid, prize token id, prize value where stated, buyer, timestamp. Stated odds per pack, with a history of changes.	Realized odds against stated odds, player analytics, notable pulls on the tape and in the report
04 Payout wallets	The addresses your Pack pays prizes and buybacks from, and a note when they change.	The economics page: spend against payouts, net, concentration. The one input that moves a venue from "no source" to counted
05 Item metadata	Per token: name, set or edition, number, grade, grader, cert number, year, language, image.	Identity resolution, the index, grade and set pages, cert lookups

One key

A partner API key with documented rate limits, a status page or webhook for outages, the terms under which we display your data with attribution, and a named technical contact on each side.

Formats we take

- REST JSON with pagination or a cursor
- Webhooks for new trades and pulls
- On-chain: addresses plus ABI, we run the indexer
- CSV history to backfill, any of the above from then on

Public tiers of ten requests a day cannot run a venue. Our usage is predictable: one history backfill, then incremental reads on a six-hour cycle, plus a daily metadata pass.

Rules we hold ourselves to

The data is yours. These are the commitments that make sharing it safe, and they apply to every venue equally.

Payout wallets under rule R3

Payouts are credited only to wallets that spent into the packs. Partner, vendor and treasury flows from the same wallet never appear, and outbound is shown as an aggregate, never as a wallet list.

Read-only, always

We never write, never trade and never hold a key with write scope. Feeds are pulled on a fixed cycle and stored in our own database.

Attribution on every surface

Your name and a link wherever your data appears, including exports and embeds. Your attribution format, your logo rules.

Withheld beats wrong

A cell with no source says so. Nothing is estimated in your name. If a build fails a completeness or sanity gate, the figure is held and the reason is printed.

Tell us what not to show

If there is data you would rather keep off the page, say so. We will show it as withheld rather than guess, and we would rather know than infer.

A named channel

One technical contact on each side, a shared expectation on uptime, and a heads-up before schema changes in either direction.

From key to live

DAY 1

Key received. We pull a sample, check fields and identity resolution, and send back what we found.

WEEK 1

History backfilled into the spine. Completeness and sanity gates run. Board and venue page go up.

WEEK 2

Economics and player analytics live where the feeds allow. Your first named appearance in the Monday report.

ONGOING

Six-hour refresh, daily spine, weekly report. Schema changes agreed in advance, both ways.

Next step. Reply with a technical contact and the feeds you can share first. Trades and metadata alone put a venue on the board. The other three complete the story.

Coverage today, cell by cell

PocketPull would be the sixth venue on the board, on Solana alongside Collector Crypt and Phygitals. Nothing is counted yet, so every cell is open and every feed lands as new coverage from launch.

LEG	STATE	SOURCE TODAY	WHAT FILLS IT
Resales	NOT YET	No feed, no program addresses	Marketplace sales feed, or the marketplace program and its events on Solana
Listings and floors	NOT YET	None	Listings feed or listing events
Holders	NOT YET	None	Collection addresses; we resolve owners on-chain
Pack spend and stated odds	NOT YET	None	Packs feed with the price and stated odds per pack
Realized pulls	NOT YET	None	Pulls feed, or the pack program address
Economics outbound	NOT YET	None	Sellback and payout wallet addresses
Card metadata	NOT YET	None	Per-token metadata with cert numbers; binder identity if you expose it

Sales and metadata alone put PocketPull on the board. Pulls, payout wallets and listings complete the economics page, and the binder identity, if exposed, is a page no other venue can have.
